

IPv6 Allocations Per Country, in the RIPE Service Area

Carlos Friças <cfriacas@fccn.pt>

FCCN = *Foundation* managing the
Portuguese Academic Network

RIPE-48, Amsterdam, 05/05/2004

<http://www.ip6.fccn.pt/v6top.html>

- Simple PERL Script
- Still some bugs ☺
- Queries the RIPEdb
- Parses “country” lines
- Runs 2 times/day

Presentation:

- Sorts # of “country” lines
- Lists the 20 countries with highest numbers
- You can click the # and see which allocations where found

Script by cfriacas@fccn.pt, Data found on the RIPE database (whois.ripe.net)

[Allocations Total: 331]

(Tue May 4 11:00:01 WEST 2004)

[\[Global IPv6 Allocation List \]](#)

Rank	Country	Allocations
1		60
2		35
3		29
4		22
5		20

Looking at the allocations! (.PT)

```

- Networks
- Netnames
 - Companies
 - Date

My Question: Is this Useful?

- Track ISPs participating in IPv6 Task-Forces, but not doing the 1st step into IPv6: get addresses (slow)
- If the numbers are presented this way (/country), will this help increase IPv6 Allocations?
- What lies behind an allocation?, more...???
